

UNIX BASICS

This exercise is designed to provide the basic skills required for working in the UNIX environment, using plenty of relevant examples, specifically for biologists. If you are using your personal computer, make sure that you have downloaded the files required for the workshop. This exercise will provide you information regarding navigation, files and directory creation/modification and some administrative things related to file permissions.

NAVIAGATION

This section will introduce you to some basic file/directory navigation and manipulation techniques.

CHANGING DIRECTORIES

To jump from one directory to another we use the cd (<u>change directory</u>) command.

cd .. Changes your present location to the parent directory

cd **DIRECTORY** This changes your location back to your **DIRECTORY**.

Task 1.1: Now change your directory to the WORKSHOP_FILES directory present in your home directory.

NOTE: You can type in first few letters of the directory name and then press tab to auto complete rest of the name (especially useful when the file/directory name is long). This only works when there are unique matches for the starting letters you have typed. If there is more than one matching files/directories, pressing tab twice will list all the matching names. You can also recall your previous commands by pressing up/down arrow or browse all your previously used commands by typing history on your terminal (typically, last 500 commands will be saved in this file).

TO KNOW THE PRESENT LOCATION OF YOUR COMMAND

pwd

/home/username

Returns you the present working directory (print working directory)

This means, you are now working in the username directory, which is located in home directory. The directory that you will be in after logging in is your home directory. You can also avoid writing the full path by using ~ in front of your username or simply ~.

~ or ~username same as/home/username

Genome Informatics Facility

Present directory is represented as . (dot) and parent directory is represented as .. (dot dot)

VIEWING THE CONTENTS OF THE DIRECTORY

The contents of a directory can be viewed using ls (*list*) command.

1s **DIRECTORY** *# now try it with* WORKSHOP_FILES *directory*

If no directory name is provided then 1s will list all the contents of the present directory.

Like any other command, you can use absolute path or abbreviated path. There are also various options available for 1s command.

Some very useful options include:

ls -1
Lists all the files in lengthy or detailed view

ls -t
Lists all the files, sorted based on creation time

ls -S
Lists all the files, sorted based on size

You can also combine these options together for getting more focused results.

Looking at the manual for ls, what option can you use to view hidden files in a directory (files starting with dot)?

Can you sort the files based on its extension? How?

Task 1.2: Examine the contents of the WORKSHOP_FILES directory. Try options such as -1, -t, -a and -X. Also check if you can combine many options together (like -1a or -1h etc). Try these:

ls -1 WORKSHOP_FILES
ls -a

DIRECTORIES AND FILES

COPYING DIRECTORIES

To copy a file, cp (copy) command is used. When using this command you have to provide both source file and destination file.

cp SOURCE DESTINATION

You can also specify the absolute path of the source and/or destination file. To know more about any command you can use man command, which opens the manual of the command you ask (referred as 'man page').

man cp

This opens the manual for the cp command. Take a look at the manual of cp command (use arrow keys to move top or bottom of the page). OPTIONS are optional arguments that can be used to accomplish more from the same command. *Eg.*, by using option -i with the regular cp command, you can always make sure that you are not overwriting the existing file while copying. The syntax for using the options will also be provided in the manual. **To exit, press q**.

Looking at the man page for cp command, what options can be used to copy a directory (including all files within it)?

How else you can get help on cp command (other than 'man')?

Task 1.3: Now change your directory back to the home directory. Create a copy of WORKSHOP_FILES and name it as BACKUP_WORKSHOP). This will serve as a backup copy of all files that are required for the workshop (in case you accidentally modify the contents while working).

cp -r WORKSHOP_FILES BACKUP_WORKSHOP

MOVING DIRECTORIES

To move a file or a directory, $mv (\underline{m}o\underline{v}e)$ command is used. Again, like the cp command you need to provide both source file and destination file.

mv SOURCE DESTINATION

Absolute path also works fine. Some of the options used by cp command also work with mv command. mv can also be used to rename files and directories

mv OLDNAME NEWNAME

Task 1.4: Rename BACKUP_WORKSHOP as BACKUP.

mv BACKUP_WORKSHOP BACKUP

ls -1 BACKUP ls -lh BACKUP ls -t BACKUP

MAKING DIRECTORIES

To create a directory, mkdir (<u>make</u> <u>dir</u>ectory) can be used.

mkdir DIRECTORY

Unlike PC/Mac folders, here you can't have space in your directory name (but some special characters are okay). You can also specify the path where you want to create your new folder.

Task 1.5: Make a new directory named FirstDirectory within the WORKSHOP_FILES directory. Then change your directory to the FirstDirectory.

mkdir FirstDirectory

DELETING FILES AND DIRECTORIES

To delete directories from the system, you can use rmdir (remove <u>directory</u>) command. You can also use rm command to delete file(s).

rmdir DIRECTORY

The directory should be empty before you use the rmdir command.

rm FILE

To delete a file rm command can be used

Some useful options include

- -r recursively delete files
- -f delete forcefully

rm -rf DIRECTORY [DO NOT USE THIS NOW!]

When you want to delete a folder, with all its content

Task 1.6: Delete the directory named delete_me inside the WORKSHOP_FILES directory (to do this you may first want to delete the sample.txt file inside this directory).

cd delete_me
rm sample.txt
cd ..
rmdir delete_me

CREATING AND EDITING FILES

touch FILENAME Creates a new file in the present location

nano FILENAME Like notepad/textedit, this text editor lets you edit a file.

Task 1.7: Create a new file named firstfile inside the WORKSHOP_FILES directory. You can create using touch or using nano. Then add some contents (Your name and email address) to the firstfile (using nano). After editing, press Ctrl + X to exit, then enter y to save changes and confirm the file name.

touch firstfile
nano firstfile

VIEWING CONTENTS OF THE FILES

There are various commands to print the contents of the file in bash. Most of these commands are often used in specific contexts. All these commands when executed with filenames displays the contents on the screen. Most common ones are less, more, cat, head and tail.

less FILENAME

try this: less AT_cDNA.fa

Displays file contents on the screen with line scrolling (to scroll you can use arrow keys, PgUp/PgDn keys, space bar or Enter key). When you are done press q to exit.

more FILENAMEtry this: more AT_cDNA.faLike less command, also, displays file contents on the screen with line scrolling but uses only spacebar or Enter key to scroll.When you are done press q to exit.

cat FILENAME try this: cat AT_cDNA.fa Simplest form of displaying contents. It <u>cat</u>alogs the entire contents of the file on the screen. In case of large files, entire file will scroll on the screen without pausing

head FILENAME try this: head AT_cDNA.fa Displays only the starting lines of a file. The default is first ten lines. But, any number of lines can be displayed using -n option (followed by required number of lines).

tail FILENAMEtry this: tail AT_cDNA.faSimilar to head, but displays the last 10 lines. Again -n option can be used to change this.

More information about any of these commands can be found in man pages (man command)

Task 1.8: Try using all these commands on theRefSeq.faa. You are also welcome to try thesecommands on various other files that are present in theWORKSHOP_FILESdirectory.Thesecommands don't change the contents of the file; they just display them on the screen.

COMPRESSING FILES

There are several options for archiving and compressing groups of files or directories. Compressed files are not only easier to handle (copy/move) but also occupy less size on the disk (less than 1/3 of the original size). In Linux systems you can use zip, tar or gz for archiving and compressing files/directories.

ZIP compression/extraction

zip OUTFILE.zip INFILE.txt
Compress INFILE.txt

zip -r OUTDIR.zip DIRECTORY
Compress all files in a DIRECTORY into one archive file (OUTDIR.zip)

zip -r OUTFILE.zip . -i *.txt

Compress all txt files in a DIRECTORY into one archive file (OUTFILE.zip)

unzip SOMEFILE.zip Decompress a file

Task 1.9: Zip AT_genes.gff file located in the WORKSHOP_FILES directory. Check the file size before and after zip compression (Hint: use 1s -1h to check file sizes).

zip AT_genes.gff.zip AT_genes.gff

Is there any size difference before and after compressing? Y/N

tar (<u>tape</u> <u>ar</u>chive) utility saves many files together into a single archive file, and restores individual files from the archive. It also includes automatic archive compression/decompression options and special features for incremental and full backups.

tar -cvf OUTFILE.tar INFILE
archive INFILE

tar -czvf OUTFILE.tar.gz INFILE archive and compress file INFILE

tar -tvf SOMEFILE.tar list contents of archive SOMEFILE.tar

tar -xvf SOMEFILE.tar
extract contents of SOMEFILE.tar

tar -xzvf SOMEFILE.tar.gz
extract contents of gzipped archive SOMEFILE.tar.gz

tar -czvf OUTFILE.tar.gz DIRECTORY archive and compress all files in a directory into one archive file

tar -czvf OUTFILE.tar.gz *.txt archive and compress all ".txt" files in current directory into one archive file

Task 1.10: Archive and compress the BACKUP_WORKSHOP directory you created in Task 1.3 (you can name it as backup.tar.gz or anything you want)

tar -czvf backup.tar.gz BACKUP_WORKSHOP

gzip (<u>g</u>nu <u>zip</u>) compression utility designed as a replacement for compress, with much better compression and no patented algorithms. The standard compression system for all GNU software.

gzip SOMEFILE compress SOMEFILE (also removes uncompressed file)

gunzip SOMEFILE.gz
uncompress SOMEFILE.gz (also removes compressed file)

Task 1.10: gzip the file AT_genes.gff and examine the size. gunzip it back so that you can use this file for the later exercises.

gzip AT_genes.gff ls -lh gunzip AT_genes.gff.gz ls -lh

PIPES AND REDIRECTS

Many UNIX commands use some input file/data and display the output on the screen. This is feasible when the data being displayed is small enough to fit the screen or if it is the endpoint of your analysis. But for large data outputs, it is efficient to redirect to a file instead of screen. This can be done very easily in UNIX using > (greater than) or < (lesser than) or >> signs.

- < redirects the data to the command for processing
- > redirects the data from the command's output to a file. The file will be created if it is nonexisting and if present it will overwrite the contents with the new output data (you will lose the original file).
- >> unlike > this redirection lets user append the data to an already existing file or a new file
- Another special operator | (called pipe) is used sometimes to pass the output from a command to another command (as input) before sending it to an output file or display.

Some eg.

cat FILE1 > FILE2

Creates a new file, FILE2 with same contents as old file, FILE1

cat FILE1 >> FILE2

Appends the contents for FILE1 to FILE2, equivalent to opening FILE1, copying all the contents, pasting the copied contents to the end of the FILE2 and saving it!

cat FILE1 | less

Here, cat command displays the contents of the **FILE1**, but instead of sending it to standard output (screen) it sends it through the pipe to the next command 'less' so that contents of the file are now displayed on the screen with line scrolling.

Task 1.11: The Sequences directory contains a number of files and each of these files contain a single FASTA formatted nucleotide sequence. Combine them all together to make a single file sequences.fasta using redirects.

cat *.fa >> sequences.fasta
this command will combine all .fa files into one.

REGULAR EXPRESSIONS

When working with the sequences (protein or DNA) we are often interested to see if a particular feature is present or not. This could be various things like a start codon, restriction site or even a

motif. In UNIX all strings of text that follow some pattern can be searched using some formula called regular expressions. *eg.* If you are looking for a particular motif in large number of sequences, then you can create a regular expression in UNIX and search all the sequences having that motif relatively easily. Regular expression consists of normal and metacharacters. Commonly used characters include

Expression	Function
•	matches any single character
\$	matches the end of a line
^	matches the beginning of a line
*	matches zero or more character
λ	quoting character, treat the next character followed by this as an ordinary character.
[]	matches one or more characters between the brackets
?	match 1 occurrence of the character

For complete list, type info regex on your terminal.

ADMINISTRATIVE COMMANDS

CHANGING PERMISSIONS

All files in the UNIX system will have a set of permissions which define what can be done with that file and by whom. (What = read (view contents), write (modify) and execute (run script) Whom=User (owner), group (that account belongs to) and everyone else). They are denoted as

PERMISSIONS		RELATIONS	
read	r	owner	u
write	W	group	g
execute	Х	others	0
		all users	а

To look at the permissions for any file, you can list the files with I option (1s -1).

Permissions	User G	roup	Size	Dat	e r	modifi	ied Name
lrwxrwxrwx 1	arnstrm	GIF	24	Jan	7	09:40	arnstrm -> /data006c/GIF_2c/arnstrm
drwxrwx 3	arnstrm	GIF	4096	Jun	4	15:27	bin
drwxrwxr-x 5	arnstrm	GIF	4096	Mar	18	09:10	coreutils
-rwxr-xr-x 1	arnstrm	GIF	11908	Jan	- 7	13:07	cshrc_severin
drwxrwxr-x 4	arnstrm	GIF	4096	Mar	18	09:17	dos2unix
-rw-rw-r 1	arnstrm	GIF	46470	May	19	09:48	gtf2gff3.pl
drwxrwxr-x 4	arnstrm	GIF	4096	Apr	10	09:15	igv
-rw-rw-r 1	arnstrm	GIF	930	May	16	11:05	<pre>module_file.txt</pre>
-rwxrwx 1	arnstrm	GIF	1228	Jun	5	14:51	template.sub
-rw-rw-r 1	arnstrm	GIF	11326	May	19	09:47	validate_features.pl

u g o

(d=directory, l=link, r=read, w=write, x=execute, -=blank, u=user, g=group, o=others)

To set/modify a file's permissions you need to use the **chmod** command (<u>ch</u>ange <u>mod</u>e). Only the owner of a file can alter a file's permissions. The syntax:

chmod [OPTIONS] RELATIONS[+ or -]PERMISSIONS FILE

 Add permissions

 chmod RELATIONS+PERMISSIONS
 FILENAME

 chmod g+rwx FILENAME
 grants read, write and execute permissions for group

 chmod g+r FILENAME
 grants read permission for group

 chmod a+rwx FILENAME
 makes the file public (don't do this to any file/directory unless you want to share)

Remove permissions

chmod	RELATIONS-PERMISSIONS	FILENAME
chmod	g-wx FILENAME	removes write and execute permissions for group
chmod	g-rwx FILENAME	removes all permissions for group
chmod	a-rwx FILENAME	removes all permissions for others
chmod	a-x FILENAME	removes execution permissions for others

OPTIONS include

- R recursively (the permissions are applied to all the files, directories present inside the directory)

Task 1.12: Check the permissions for the files located in the WORKSHOP_FILES directory. Do

ls -1

What permissions does the group have on these files?

Which group does your account belong to?

TR

The tr (<u>tr</u>anslate) utility in UNIX can translate or transliterate the input to produce a modified output. It uses 2 sets of parameters, and replaces occurrences of the characters in the first set with the corresponding elements from the other set.

tr [OPTIONS] "STRING1" "STRING2" <INFILE >OUTFILE

Useful options are

 c complements the set of characters specified by string 	g1
-----------------------------------------------------------------------------	----

- -d delete occurrences of string1 (string2 not needed)
- s squeeze repeats or multiple occurrences found in string1 will be replaced with one string2

Common uses of tr command are:

tr "a-z" "A-Z" or tr "[:lower:]" "[:upper:]"

Convert lower case to upper case (or upper to lower case)

tr -s '\n'

Convert each sequence of repeated newlines to a single newline

Files generated in both Mac and Windows OS will have a different **newline** character (to mark the end of the line) that is not recognized by the UNIX OS. Similarly files generated in UNIX will have a different newline that can't be read in Windows or Mac OS. The 'tr' command provides an easy way to convert these 'newlines' to different forms.

tr '\r' '\n' <MAC.TXT >UNIX.TXT Convert Mac text file to UNIX text file

tr '\n' '\r' <UNIX.txt >MAC.TXT Convert UNIX text file to MAC text file

tr -d '\015' <WIN.TXT >UNIX.TXT Convert Windows text file to UNIX text file

tr '\n' '\015'<UNIX.txt >WIN.TXT Convert UNIX text file to windows text file

NOTE: There are in built commands like dos2unix, mac2unix and unix2dos to do these conversions automatically in most recent versions of UNIX.

There are several utilities that can mask low complexity regions of the genomes such as repeats. They do that either by converting the bases/residues to lower case (soft masking) or converting them to N or X (hard masking). The public databases often store these soft masked genomes. When downloaded it might be useful to remove the masking, if your analysis doesn't require it (pattern searching etc.). It can be easily done by changes cases

tr "ATGC" "atgc" <AT_cDNA.fa >AT_cDNA_tr.fa
Converts masking from the sequences and saves them in a new file

tr "ATGC" "AUGC" <AT_cDNA.fa > AT_rna.fa Converts cDNA to mRNA sequence and saves them in a new file

WORD COUNT

wc (word count) is another useful command that lets you count the number of words (and lines) in a file

wcFILENAMEtry thiswcAT_genes.gffThis outputs both number of words as well as lines in a file.

wc -1 FILENAMEtry thiswc -1 AT_genes.gffOutputs only number of lines in file

Often these commands are "piped" with other commands to count certain things. *eg.*: Counting the number of files in a directory, counting the number of sequences etc.

Task 1.13: Count how many files with .fa extensions are present in sequences directory.

ls Sequences| wc -1

SORT

sort command can be used to arrange things in a file. Simplest way to use this command is:

sort FILE1 > SORTED_FILE1

Useful options include

- -n numerical sort
- -r reverse sort
- -k N,Nsort the Nth field (column), where N is a number. Sorting can also be done on the exact
character on a particular field eg. -k 4.3,4.4 sorts based on 3rd and 4th character of
the 4th field. Additionally you can supply additional -k for resolving ties.
- -t specify the delimiters to be used to identify fields (default is TAB) *eg.* -t : to use ':' as delimiter

Task 1.14: The Sequences directory consists of numerically labeled files. UNIX can sort either alphabetically or numerically (not both) and hence they are arranged in NT1.fa, NT10.fa, NT11.fa etc. In order to sort them in an easy to read way, try using

ls |sort -n -k 1.3,1.4

This command lists all the files in sequences directory and then passes it to sort command. Sort command then sorts it numerically but only using 3rd and 4th letters of the first field (file name)

Try using sort on AT_genes.gff file

sort -r -k 1,1 AT_genes.gff
sort -r -k 4,4 AT_genes.gff

UNIQ

uniq (*uniq*ue) command removes duplicate lines from a sorted file, retaining only one instance of the running matching lines. Optionally, it can show only lines that appear exactly once, or lines that appear more than once. uniq_requires sorted input since it compares only consecutive lines.

uniq [OPTIONS] INFILE OUTFILE

Useful options include

- c count; prints lines by the number of occurrences
- -d only print duplicate lines
- u only print unique lines
- -i ignore differences in case when comparing
- -s N skip comparing the first N characters (N=number)

Task 1.15: Number each lines based on number of occurrences:

uniq -c ids.txt

Print only duplicated lines.
uniq -d ids.txt

Print only unique lines.

uniq -u ids.txt

COMPARING FILES

diff (*diff*erence) reports differences between files. A simple example for diff usage would be

diff [OPTIONS] FILE1 FILE2

Useful options include

- -b ignore blanks
- -w ignore white space (spaces and tabs)
- -i ignore case
- r recursively compare all files (when comparing folders)
- s list all similar files (when comparing folders)
- -y side by side comparison of files

The differences reported will be in the form of corrections that are required to change the first file to second file

Generate diffIDs.txt by comparing the differences between ids_a.txt and ids_b.txt

diff -y ids_a.txt ids_b.txt > diffIDs.txt

Are these files different?

comm (common) command compares two sorted files line by line.

comm [OPTIONS] FILE1 FILE2

- -1 suppress lines unique to FILE1
- 2 suppress lines unique to FILE2
- -3 suppress lines that appear in both files

Task 1.16: Compare the same files (ids_a.txt and ids_b.txt) again with 'comm' command and see how the outputs differ

comm -1 ids_a.txt ids_b.txt
comm -2 ids_a.txt ids_b.txt
comm -3 ids_a.txt ids_b.txt

DIVIDING FILES

cut divides the file into several parts and displays selected columns or fields from each line of a file. Normally cut command requires how the fields are separated and what fields needs to be displayed.

cut -d "," -f 2-4 FILE	displays columns 2,3 and 4 of a file separated by ","
cut -d " " -f 1,10 FILE	displays 1^{st} and 10^{th} columns of a file separated by " "
cut -f 1 FILE	displays 1 st column of a file, assumes TAB as delimiter

split generates output files of a fixed size (bytes or lines). Useful when huge file needs to be processed. *eg.,*

split -d -l 100 FILENAME SUFFIX

here -d specifies numeric suffix only (suffix00, sufix01, suffix02 *etc*.) while -1 specifies number of lines in each file (100 in this case). If you want to split based on bytes, you can use -b option (*eg.* -b 1k or b 1m for 1 KB and 1 MB respectively)

From the commands that you have learned, can you combine the all the split files into a single file again?

Task 1.17: Display only first column of theAT_genes.gfffile using cutcut -f 1 AT_genes.gff(press ctrl + c to exit) orcut -f 1 AT_genes.gffless

```
Similarly, display 1st, 4th and 5th column of theAT_genes.gffcut -f 1,4,5 AT_genes.gff(press ctrl + c to exit) orcut -f 1,4,5 AT_genes.gff | less
```

```
Verify if all the columns in AT_genes.gff file has same number of entries in every field
cut -f 1 AT_genes.gff |wc -1
cut -f 2 AT_genes.gff |wc -1
cut -f 3 AT_genes.gff |wc -1
```

Split the file AT_genes.gff every 100,000 lines. Use gff_split as suffix for the files and use numerical suffix.

split -d -l 100000 AT_genes.gff gff_split

How many split files are generated:

ls gff_split* |wc -1

COMBINING FILES

paste prints lines consisting of sequentially corresponding lines of each specified file. eg.,

paste FILE1 FILE2 > FILE3

Combines the contents of FILE1 and FILE2, side by side generating a new file, FILE3.

Task 1.18: Combine columns of ids_a.txt and ids_b.txt files.

paste ids_a.txt ids_b.txt

How many columns do you see after combining?

join combines two files based on the common field that is specified

join -t':'-1 N-2 NFILE1 FILE2-t':'Specify field separator (here ":" but you can specify anything. Default is TAB)-1 NCommon field number (N) from the 1st file-2 NCommon field number (N) from the 2nd file

Task 1.19: Join columns based on column 1 in genes_a.gff and column 3 in genes_b.gff

join -1 1 -2 3 genes_a.gff genes_b.gff

DOWNLOADING DATA

In order to start using the computational power of the HPC cluster, you need to first get the data there. If your data is already in your local computer, you can transfer them easily using WinSCP software or any other software (refer prerequisites). But if the data that you will be using is available in the public databases then you can directly get it from there using curl or wget command (<u>W</u>WW <u>get</u>)

To download data from NCBI Sequence Read Archive (SRA) or genomics core website or any other website:

curl -0 http://website.url

If using wget then,
wget http://website.url

As an example, we will download *Glycine max* (soy bean) annotation information file from Phytozome DB.

curl -0 http://goo.gl/CDXx15

This is a single line command and you will see 'Gmax_189_annotation_info.txt.gz' file after few seconds. You can extract it and view it or delete it using the commands you have learnt.

QUICK REFERENCE SHEET

COMMANDS USED IN THIS MANUAL

Command	Function	Syntax/example usage
Navigation	Tunction .	Syntaxy example usage
15	list contents	
nwd	nrint working directory	
cd	change directory	cd ~ on cd #home directory
cu	change directory	cd #previous (parent directory)
File/Directo	ry operations	<i>mprevious</i> (purein uncetory)
mkdir	make directory	mkdir DIRECTORY
cp	conv files/directories	cp SOURCE DESTINATION
man	manual page (help)	man COMMAND
mv	move files/directories	my SOURCE DESTINATION
touch	create file	touch FILE
nano	edit file	nano FILE
less	view file (with more options)	less FILE
more	view file (with less options)	more FILE
cat	catalog file contents	cat FILE
head	show first few lines of a file	head FILE
tail	show last few lines of a file	tail FILE
rmdir	remove empty directory	rmdir DIRECTORY
rm	remove file(s)	rm FILE
Compressio	n/archiving	
zip	zip compress	zip OUTFILE.zip INFILE.txt
		zip -r OUTDIR.zip DIRECTORY
unzip	decompress zipped file	unzip ANYTHING.zip
tar	archive and compress files/directories	<pre>tar -czvf OUTFILE.tar.gz DIRECTORY #compress</pre>
		tar -xzvf OUTFILE.tar.gz #extract
gzip	gzip files	gzip SOMEFILE
gunzip	decompress gzipped files	gunzip SOMEFILE.gz
File permiss	ions	
chmod	change permissions for files/directories	<pre>chmod [OPTIONS] RELATIONS[+/-]PERMISSIONS FILE</pre>
File manipu	lations	
grep	search a pattern	grep [OPTIONS] "PATTERN" FILENAME
sed	stream edit a file	sed 's/search/replace/g' FILENAME
awk	multi-purpose command	awk 'PATTERN {ACTION}' FILENAME
tr	translate or transliterate a file	<pre>tr [OPTIONS] "STRING1" "STRING2" <infile< pre=""></infile<></pre>
WC	word count	wc FILENAME
sort	sort files	<pre>sort FILE1 > SORTED_FILE1</pre>
uniq	display unique lines	uniq [OPTIONS] INFILE > OUTFILE
diff	display difference	diff [OPTIONS] FILE1 FILE2
comm	display common lines among files	comm [OPTIONS] FILE1 FILE2
cut	break files vertically based on fields	cut -d "DELIMITER" -f NUMBER FILE
split	break files horizontally	split [OPTIONS] FILENAME
paste	combine files side by side	<pre>paste FILE1 FILE2 > FILE3</pre>
join	join files based on common field	join -t'DELIMITER' -1 N -2 N FILE1 FILE2

Genome Informatics Facility

ADDITIONAL COMMANDS

Command	Function
du -sh <mark>DIR</mark>	show directory size
whoami	display username
date	system date/time
cal	calendar
findname FILE	find a file/directory
which <mark>CMD</mark>	display default cmd path
whereis CMD	show possible locations of cmd
locate FILE	find instances of a file
clear	clear screen
sleep <mark>5</mark>	pause 5 (any) seconds
top	current running processes
ps	current running processes
wget URL	download specified URL

NANO SHORTCUTS

Commands	Function
ctrl+r	read/insert file
ctrl+o	save file
ctrl+x	close file
alt+a	start selecting text
ctrl+k	cut selection
ctrl+u	uncut (paste) selection
alt+/	go to end of the file
ctrl+a	go to start of the line
ctrl+e	go to end of the line
ctrl+c	show line number
ctrl+_	go to line number
ctrl+w	find matching word
alt+w	find next match
ctrl+\	find and replace

PRE-DECLARED VARIABLES

Variables*	Description
\$USER	username
\$HOME	home path
\$PWD	working directory path
\$PATH	path for executables
\$HOSTNAME	machine name
\$SHELL	current shell
<pre>\$SSH_CLIENT</pre>	local client's IP address
\$TERM	type of terminal

* env command lists all the assigned variables

Commands	Function
ТАВ	autocomplete names
UP/DOWN	browse previous commands
ctrl+c	interrupt/kill anything
ctrl+l	clear screen
ctrl+d	quit, exit
ctrl+z	suspend (use fg to restore)
!!	repeat last command
alt+.	last argument of previous cmd
ctrl+insert	copy selection
shift+insert	paste copied text
ctrl+a	go to start of the line
ctrl+e	go to end of the line
ctrl+r	reverse search history
cd ~	go to home

SHORTCUTS

PIPES, REDIRECTS

Redirects	Function
cmd < file	use file as input
cmd > file	write output to file
cmd >> file	append output to file
cmd 2> stderr	error output to file
cmd 1>&2 file	send output and error to file
cmd1 cmd2	send output of cmd1 to cmd2

Command	Function	Syntax/example usage
